◆□▶ ◆□▶ ★ □▶ ★ □▶ → □ → の Q (>)

If  $\exists$  simple graph G(V, E) with  $d(G) = \mathbf{d}$ 

 $\Rightarrow \qquad \mathbf{d} \text{ is a graphical sequence} \\ G \text{ realizes } \mathbf{d}.$ 

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences G(V; E) simple graph;  $V = \{v_1, v_2, \dots, v_n\}$  nodes positive integers  $\mathbf{d} = (d_1, d_2, \dots, d_n)$ .

If  $\exists$  simple graph G(V, E) with  $d(G) = \mathbf{d}$ 

 $\Rightarrow$  **d** is a graphical sequence

G realizes d.

Question: how to decide whether d is graphical?

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences G(V; E) simple graph;  $V = \{v_1, v_2, \dots, v_n\}$  nodes positive integers  $\mathbf{d} = (d_1, d_2, \dots, d_n)$ .

If  $\exists$  simple graph G(V, E) with  $d(G) = \mathbf{d}$ 

⇒ d is a graphical sequence G realizes d.

Question: how to decide whether d is graphical?

- Tutte's *f*-factor theorem (1952) - applied for K<sub>n</sub>

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences  $maxC_u(G) = #$  of circuits in a max. circuit decomposition

### circuit C is **elementary** if

1 no vertex appears more than twice in C,

2  $\exists i, j \text{ s.t. } v_i \text{ and } v_j \text{ occur only once in } C \text{ and they have different parity (their distance is odd).}$ 

#### Lemma

Let  $C_1, \ldots, C_\ell$  be a max. size circuit decomposition of G.  $\Rightarrow$  each circuit is elementary.

## Shortest swap sequences in undirected case

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences  $G_1$  and  $G_2$  realizations of **d**.  $dist_u(G_1, G_2) = length$  of the shortest swap sequence  $maxC_u(G_1, G_2) = \#$  of circuits in a max. circuit decomposition of  $E_1 \Delta E_2$

# Shortest swap sequences in undirected case

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences  $G_1$  and  $G_2$  realizations of **d**.  $dist_u(G_1, G_2) = length of the shortest swap sequence$   $maxC_u(G_1, G_2) = \#$  of circuits in a max. circuit decomposition of  $E_1 \Delta E_2$ 

Theorem (Erdős-Király-Miklós, 2012)

For all pairs of realizations  $G_1, G_2$  we have

$$dist_u(G_1, G_2) = \frac{|E_1 \Delta E_2|}{2} - maxC_u(G_1, G_2).$$

# Shortest swap sequences in undirected case

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences  $G_1$  and  $G_2$  realizations of **d**.  $dist_u(G_1, G_2) = length of the shortest swap sequence$  $<math>maxC_u(G_1, G_2) = \#$  of circuits in a max. circuit decomposition of  $E_1 \Delta E_2$ 

Theorem (Erdős-Király-Miklós, 2012)

For all pairs of realizations  $G_1, G_2$  we have

$$dist_u(G_1, G_2) = \frac{|E_1 \Delta E_2|}{2} - maxC_u(G_1, G_2).$$

Very probably the values are NP-complete to be computed

# Shortest swap sequences in undirected case

Swapdistances P.L. Erdös

Definitions and History

Undirected swapsequences

Bipartite degree sequences

Directed degree sequences  $G_1$  and  $G_2$  realizations of **d**.  $dist_u(G_1, G_2) = length$  of the shortest swap sequence  $maxC_u(G_1, G_2) = \#$  of circuits in a max. circuit decomposition of  $E_1 \Delta E_2$ 

Theorem (Erdős-Király-Miklós, 2012)

For all pairs of realizations  $G_1, G_2$  we have

$$dist_u(G_1, G_2) = \frac{|E_1 \Delta E_2|}{2} - maxC_u(G_1, G_2).$$

Very probably the values are NP-complete to be computed New upper bound:

$$\mathsf{dist}_u(G_1,G_2) \leq \frac{|E_1 \Delta E_2|}{2} - 1$$
